

Airline Reservation System - Manual QA Portfolio

A practical manual QA project executed against the PHPTRAVELS demo environment, covering the airline booking lifecycle from flight search to payment, booking management, cancellation/refund behavior, and end-to-end validation.

What I Tested

- Flight search validation and result accuracy
- Fare calculation and fare consistency
- Passenger details, boundary and category validation
- Stripe Sandbox payment success/failure behavior
- Booking persistence and Admin retrieval
- Cancellation and refund behavior
- End-to-end booking flows
- Requirement traceability and defect management

Execution Results

Metric	Result
Total test cases	39
Passed	29
Failed	4
Blocked	4
Not Executed	2
Pass rate among Pass/Fail executions	87.9%

Representative Defects Found

- Same origin and destination accepted during flight search (DEF-FS-001)
- Excessively long passenger name accepted and silently truncated (DEF-PAX-001)
- Child/Infant passenger combinations returned no inventory despite adult-only availability (DEF-PAX-002)
- Cancellation processing blocked by Sabre API invalid response / PNR-not-issued condition (DEF-CAN-001)
- Payment gateway-limit behavior documented and successfully retested (DEF-PAY-001)

QA Artifacts

This repository includes a test plan, requirements, test scenarios, executed test cases, RTM, defect log, test summary report, and execution evidence.

Tools / Environment

PHPTRAVELS demo, browser-based manual testing, Admin portal validation, Stripe Sandbox, spreadsheet-based test management, Git/GitHub.

Key QA Principle Demonstrated

Blocked or non-reproducible scenarios are reported as **Blocked / Not Executed** instead of being artificially marked as Pass. Defects are logged only when supported by observed evidence.
